

Ground Loop Isolator

GLIRCA

The RECOIL GLIRCA filter creates 1.3dB signal gain for improved performance as well as eliminating engine noise caused by a ground loop. The RCA plugs (male) are the input to the GLIRCA and must be plugged into the source unit. The red RCA plug is the right channel and the white RCA plug is the left channel. The RCA jacks are the output for the GLIRCA. The brown wires are not usually used. The brown ground wires are to be used to only if no sound is audible on both channels. Attach the brown wires to the source unit's ground.
